

• Http Request •
to router

• Router •

takes in and handles
requests in order to pass
on to Middle Ware

• Middle Ware •

invokes functions on the
requests before sending
to controller

→ splits code into modules

• Controller •

uses CRUD functions
to send responses back
and communicate with database

• Database •

stores data from previous requests

This is definitely nice to
see the bigger picture and
actual flow of events from
start to finish.
